

Swiggy Sales Descriptive Analytics Report

Top 200 Localities — Sales, GMV & Operational Analysis

Dataset note: The supplied dataset contains 200 locality-level leaderboard records across 38 cities. It does not contain a date/month column, so monthly sales trend and month-on-month growth graphs are not supported by this file.

Name: Shruti Tiwari

Section:BCADS27

Roll no: 1250258445

Date: 13/08/2026

A. Objectives & Business Questions

1. How are total orders distributed across the Top 200 Swiggy localities?
2. Which localities contribute the highest number of orders?
3. Which localities generate the highest GMV?
4. Which cities contribute the highest total order volume?
5. Which cities generate the highest GMV?
6. How does average order value vary across cities?
7. How closely are order volume and GMV related across localities?
8. How does customer rating vary across localities?
9. Is higher customer rating associated with higher order volume?

10. Which cities have comparatively high cancellation rates?
11. Which localities have the highest cancellation rates?
12. How does average delivery time vary across cities?
13. Which localities have comparatively high delivery times?
14. Which cities have the broadest locality coverage?
15. How concentrated are orders among the Top 200 localities?
16. Which cities combine high order volume and high GMV?
17. Which states/UTs contribute the most orders?
18. Which states/UTs contribute the most GMV?

Top 10 Localities by Total Orders

Insights:

- Gurgaon Cyber City records the highest order volume at **1,912,143 orders**.
- The leading localities are concentrated in major urban markets, showing strong demand in highdensity food-delivery areas.
- The top 10 localities together account for 9.94% of all orders represented in the dataset.
- These high-volume localities should receive strong attention for restaurant availability, delivery capacity and peak-period operations.

KPI:

- Top locality: Gurgaon Cyber City
- Total orders: 1,912,143
- Top 10 order share: 9.94%

Top 10 Localities by GMV

Insights:

- Gurgaon Cyber City leads locality-level GMV at INR 957.65 million.
- The highest-GMV localities broadly overlap with the highest-order localities.
- The top 10 localities contribute 12.70% of total GMV in the supplied dataset.
- High-GMV localities are important markets for protecting service quality while maintaining order availability.

KPI:

- Top locality by GMV: Gurgaon Cyber City
- GMV: INR 957.65 million
- Top 10 GMV share: 12.70%

Top 10 Cities by Total Orders

Insights:

- Delhi NCR is the leading city by total orders with 21,064,576 orders.
- Delhi NCR, Mumbai and Bengaluru form the strongest group of city-level demand in the dataset.
- Higher-order cities represent larger operational workloads and therefore need adequate delivery partner and restaurant capacity.
- City-level order concentration can support resource allocation and peak-demand planning.

KPI:

- Top city by orders: Delhi NCR
- Total orders: **21,064,576**

Top 10 Cities by GMV

Insights:

- Delhi NCR generates the highest city-level GMV at INR 8.31 billion.
- The ranking of high-GMV cities closely follows the ranking of high-order cities.
- This indicates that order volume is a major driver of city-level GMV.
- Differences between orders and GMV can also reflect variations in average order value.

KPI:

- Top city by GMV: Delhi NCR
- GMV: **INR 8.31 billion**

Average Order Value by Top 10 Cities

Insights:

- The overall weighted average order value across the supplied dataset is approximately INR 365.73.
- Among the top-order cities, Bengaluru has the highest average order value at approximately INR 386.29.
- A higher average order value means a city can generate stronger GMV without requiring the same proportional increase in order volume.
- AOV should therefore be considered together with order volume when comparing city performance.

KPI:

- Overall weighted AOV: **INR 365.73**
- Highest top-order-city AOV: Bengaluru - **INR 386.29**

Locality Orders vs GMV

Insights:

- The locality-level correlation between orders and **GMV is 0.993**, indicating a very strong positive relationship.
- Localities with higher order volumes generally generate higher GMV.
- The relationship is not necessarily perfectly proportional because average order value varies across localities.
- The chart confirms that order volume is a key contributor to overall commercial value.

KPI:

Orders GMV correlation: **0.993**

Relationship: Very strong
positive

Customer Rating vs Total Orders

Insights:

- The average locality rating is 4.360/5.
- The correlation between rating and total orders is -0.014, indicating almost no linear relationship in this dataset.
- High order volume therefore does not automatically imply a higher customer rating.
- Customer experience should be monitored as a separate KPI rather than inferred from demand alone.

KPI:

- Average locality rating: 4.360/5
- Rating orders correlation: -0.014

Average Cancellation Rate by Top 10 Cities

Insights:

- The overall average cancellation rate across the **200 localities** is approximately 4.14%.
- Cancellation performance differs across cities even among high-order markets.
- Cities with higher cancellation rates may require closer monitoring of restaurant readiness, order acceptance and delivery operations.

- Cancellation should be evaluated alongside order volume so that operational risk is prioritized by business impact

KPI:

- Average cancellation rate: **4.14%**
- Localities covered: **200**

Average Delivery Time by Top 10 Cities

Insights:

- The overall average delivery time across the dataset is approximately 27.34 minutes.
- Delivery time varies across the leading cities, indicating differences in local operating conditions.
- Higher delivery times can affect customer experience, especially in high-order markets.

- Operational planning should focus on cities where delivery time and order volume are simultaneously High

KPI

- Average delivery time: 27.34 minutes

Top 10 Cities by Locality Coverage

Insights:

- The number of represented localities differs across cities.
- Cities with broader locality coverage have more individual areas represented in the leaderboard.
- City totals should therefore be interpreted together with locality coverage.
- A city with more tracked localities can naturally accumulate a larger total order and GMV contribution.

KPI:

- Localities represented: **200**
- Cities represented:
38

Top 10 Localities by Cancellation Rate

Insights:

- Fort Kochi has the highest recorded cancellation rate at **5.1%**.
- The highest-cancellation localities indicate areas where operational performance deserves additional attention.
- High cancellation rates can reduce realized order value even when demand is strong.

- These localities are useful candidates for targeted investigation of restaurant and delivery processes.

KPI:

- Highest locality cancellation rate: **5.1%**
- Locality: Fort Kochi

Top 10 Localities by Average Delivery Time

Insights:

- Ballygunge records the highest average delivery time at 28.7 minutes.
- Longer delivery times identify localities where fulfillment speed may be a comparatively important operational issue.

- Delivery-time monitoring is especially important when the same locality also has high order volume.
- Local operational conditions should be reviewed before making broad city-level conclusions.

KPI:

- Highest locality average delivery time: **28.7 minutes**
- Locality: Ballygunge

Locality Demand vs GMV Opportunity Map

Insights:

- The chart separates localities into high/low groups using the median order volume and median GMV as reference points.

- High-orders/high-GMV localities represent the strongest commercial and operational priority.
- Lower-orders/lower-GMV localities may represent smaller markets or areas with comparatively lower demand.
- The opportunity map helps distinguish high-value markets from lower-volume markets using both demand and monetary contribution.

KPI:

- Opportunity basis: Median order volume + median GMV

State / UT Orders

Insights:

- Maharashtra records the highest total order volume at approximately 35,683,885 orders.

- Higher-order states represent larger operational workloads and should receive adequate delivery and restaurant capacity.

KPI :

- Top state/UT by orders: Maharashtra
- Orders: **35,683,885**

State / UT GMV

Insights:

- Maharashtra is the highest-GMV state / UT in the derived aggregation, contributing approximately INR **13.68 billion**.
- GMV highlights where the largest monetary contribution is concentrated.

KPI:

- Top state/UT by GMV: Maharashtra
- GMV: INR **13.68 billion**

Summary of Key Metrics

Swiggy Sales Descriptive Analytics Report

The following key metrics summarize the major sales, value, customer-experience and operational indicators from the supplied Top 200 Swiggy locality dataset. This section is intended to appear immediately before the Descriptive vs Predictive Analytics section.

Metric	Value
Total Localities / Records	200
Cities Covered	38
Top Locality by Orders	Gurgaon Cyber City — 1,912,143 orders
Top Locality by GMV	Gurgaon Cyber City — INR 957.65 million
Top City by Orders	Delhi NCR — 21,064,576 orders
Top City by GMV	Delhi NCR — INR 8.31 billion
Overall Weighted Average Order Value (AOV)	Approximately INR 365.73
Highest AOV among Top-Order Cities	Bengaluru — approximately INR 386.29
Orders–GMV Correlation	0.993
Average Customer Rating	4.360 / 5

Rating-Orders Correlation	-0.014
Overall Average Cancellation Rate	Approximately 4.14%
Highest Locality Cancellation Rate	Fort Kochi — 5.1%

Descriptive vs Predictive Analytics

Descriptive analytics: The supplied dataset supports descriptive analysis of orders, GMV, AOV, ratings, cancellations and delivery time across the Top 200 localities.

Predictive analytics: A reliable forecast cannot be built from this file because it has no date/month field or future target variable. Historical time-series data would be required for forecasting orders or GMV.
